A year-long program of current profile, water level and temperature measurements are being carried out in the vicinity of exploratory offshore drilling in the area northeast of Equatorial Guinea.

Meteorological data (winds, air temperature, and humidity) are being measured concurrently from a weather station installed on the drilling platform. The year-long data sets will be analyzed to provide input to developing a production system for this area.

**Location:** Equatorial Guinea  
**Client:** Noble Energy EG Ltd.  
**Dates:** Feb/07-June/08
